

Description of Components

Hydraulic Modulator and Control Unit

The hydraulic modulator and control unit is an assembly, which is mounted in an anti-vibration bracket at the services compartment. A g-sensor is located in the control unit.

T 9259

• Service

The control unit can be replaced separately. The hydraulic modulator is supplied already filled.

If a fault is recognised that will affect the integrity of the ABS, the control unit switches off the ABS, lights the ABS telltale and stores the appropriate trouble code.
